Freight Matrices

AXS Dry's freight matrix is the perfect tool to calculate voyage estimates in a given trade on a Time Charter (TC) or Voyage basis, based on automatically-updated market indices and broker indications. To make simulations easier, the possibility to choose specific bunker prices has also been introduced; a TC correction factor exists to allow the flexibility for "border" trades to be studied.

- A complete overview of any basin at a glance
- The ideal "view and do" tool to calculate voyage estimates in any given trade on a Time Charter (TC) or Voyage basis, based on automatically-updated market indices and broker indications
- Used daily by almost 30 charterers for benchmarking, budgeting, and more
- Accessible from any computer anytime: you just need an Internet connection

Functionalities

- **Public matrices** are published on our website, as well as on Lloyds List and Reuters. Fully confidential private matrices can be designed to your specific needs and requirements upon request.
- To make simulations easier, subscribers can choose specific bunker prices; a Time Charter correction factor exists to allow the flexibility for "border" trades to be studied. RBCT to Europe routes can be included in transatlantic matrices.
- Calculate any voyage for any commodity, for ex Coal Cape Transatlantic, or Grain PMX from the US Gulf to the Far East. Our tool is used by steel mills (Arcelor Purchasing), energy producers (ENEL), coal traders (Total Coal), sugar and grain importers, fertilizer traders, and more.
- Up to 110 calculations can be performed per second, taking into consideration any commodity, and all vessel sizes. FX and bunker prices are automatically updated. Calculations are performed on the basis of a TC Equivalent or a given specified voyage rate.
